In-Class Assignment L9-1 (Group of 3 or less): Boyer-Moore Substring search

Suppose you want to search for a DNA gene pattern 'TGACGA' in a DNA string by using Boyer-Moore algorithm. Each position in a DNA string is taken from one of the four letters 'A', 'C', 'G', 'T'.

- Determine the shift table for bad-symbol shifts
- Determine the good-suffix shift table.
- For the DNA string TAGTAGCGATGACGACA, how many pattern shifts and comparisons does it take to find 1st appearance of the pattern? Show how the pattern was shifted during the algorithm execution.

k	Pattern	d_2
1	T G A C G A	
2	T G A C G A	
3	T G A C G A	
4	T G A C G A	
5	T G A C G A	

T A G T A G C G A T G A C G A C A

T G A C G A
