Algorithm BluePatches

```
1: Input: Colors, a sequence of colors (red, green, blue) for n ≥ 2 hexagons
2: Output: The number of blue patches
3:
4: BlueCount ← 0
5: n ← Length(Colors)
6:
7: for i = 1 to n do
8:     if Colors[i] == Blue then BlueCount ← BlueCount +1
9:
10: for r = n − 1 to 1 do
11:     Initialize AboveColors as an array of size r
12:     for j = 1 to r do
13:         if Colors[j] == Colors[j + 1] then
14:             AboveColors[j] ← Colors[j]
15:         else if Colors[j] == Red or Blue and Colors[j + 1] == Red or Blue then
16:             AboveColors[j] ← Green
17:         else if Colors[j] == Red or Green and Colors[j + 1] == Red or Green then
18:             AboveColors[j] ← Blue
19:         else
20:             AboveColors[j] ← Red
21:         if AboveColors[j] == Blue then
22:             BlueCount ← BlueCount +1
23:     Colors ← AboveColors          # Copy array AboveColors to Colors
24:
25: return BlueCount
```

Example Solution

Your answer could look different
but is valid if it meets the
five essential properties of an algorithm
and solves the task.
